

## AI Tools

AI tools are on fashion. Developers are exploring the potential of tools such as chat GPT to generate automatically apps. There are many examples of code produce by AI tools. Research and select one tool, explore and try some examples to produce UI that includes specific features related with usability attributes. Based on your research and experience explain the real potential of the AI tools and the constrains. Provide some arguments related the following points:

- What's the quality of the UI you could produce?
- How was your experience producing UI with an AI tool? Is it easy to use the AI tool?
- Considering the final result of the UI, to how extend it include the usability attribute?
- Will the UX role change significantly with the development of AI tools? How?

Well, I think the quality of the UI is relative to how much complex is the prompt that you enter to the IA. When I asked for UI the result were satisfactory, I mean is not an awful result, probably a guide for the final form, but if you compare the IA between what you can make thinking by your own, the UI made by the IA is really poor. So the main point is that the tool is really easy to use, but you need to create a good prompt and modify that result that the IA give you to ensure that it is what you wanted to do.

I don't understand completely what means extend it but I think that it depends on how is the design of the UI, like if is traditional or following some basic and common patterns probably the result will include the usability attributes that we specified to the IA, but if it is something complex or new, the answer is that don't includes. I don't think that the role is going to change significantly, because it's the same argument that we aren't going to need developers because IA but the complexity of some software is so high that reminds what the IA is for, not a substitute, a tool (instead we have a massive advance of IA that doesn't seems like). So, the changes will be the implementation of this tool as a fundamental part of the UX role for some tasks, and probably you need to learn with capacitation how to use properly this tool.
