

## ElicitationMethods

Elicitation methods are essential techniques/tools for User Research. Based on your team project provide a contrast of an elicitation technique used by the team based on an artifact on the project's repo. The goal of this reflection is to provide clear information regarding how close (or far) the team followed. Provide a constructive criticism how the technique and resulting artifact could be improved. Provide following points:

- **Considerations of the original technique.**
- **How your team did implement the technique?**
- **Outcome of the technique (based on artifacts). What could be improved?**
- **Reflect how you could improve the technique/method/artifacts/items to collect data and analyze information, estimation time to process whole information, mistakes detected during the execution, etc.**

Our team use the survey technique to recollect the data of the users. We were expected to obtain qualitative and quantitative data. One problem with this technique is that we need so many people to answer for a better analysis of the data.

Our team design the survey based on the top topics that involves the problem of a musician that wants to find a job, the survey was made in a google forms because is simpler and easier to send to all the people.

Well the Outcome I can tell that was very fructiferous because all the information was relevant to identify the main target of the project, but I think we could improve in the way that some questions were made and I would like to add more questions but it probably be a bad idea because the people who answer probably is going to get upset.

I think we can improve in the way that we present the item to collect the information, more than the item itself. I mean, probably if the people get interested by the topic, they probably don't going to be mad even if there are so many questions, so, make a backstory of the product or a video that caught the attention of the viewers that kind of thing probably improves the results of the data collection, and that is what I think we miss in our project, because obtain that 10 people was really hard, more than the analysis or other phases of this process.
