AITools

AI tools are on fashion. Developers are exploring the potential of tools such as chat GPT to generate automatically apps. There are many examples of code produce by AI tools. Research and select one tool, explore and try some examples to produce UI that includes specific features related with usability attributes. Based on your research and experience explain the real potential of the AI tools and the constrains. Provide some arguments related the following points:

- **What's the quality of the UI you could produce?**

- **How was your experience producing UI with an AI tool? Is it easy to use the AI tool?**

- **Considering the final result of the UI, to how extend it include the usability attribute?**

- **Will the UX role change significantly with the development of AI tools? How?**

https://youtu.be/uwSY9XqQGXw

It's weird thinking about a UI produced by AI, the quality of the results I would say are acceptable, at the end we should think about AI as a tool and not much as a substitute of the designer. The UI result needs to be edited to fit the requirements, not even with the best prompt we would get exactly what we want. AI isn't human so it can´t be creative, we even could say it lacks the soul to give us what the humans love. AI right now it's a mish mash of a lot of information and it´s kind of a Frankenstein´s monster when it comes to giving emotions.

Of course, using the AI tool is pretty easy, and the experience using it feels great because you don't have to work that hard in comparison, we could say it's an acceptable ground to work with. The usability is almost the same with the UI, you always need to correct and add more thing to make it good and how you actually need it and want it.

Maybe not that in the future the UX role will change, needing to learn how to use the AI tool to help, but I like to think that a person would always be essential to do the work, as the same an artist is essential to do art.
