Human Computer Interaction

UXTesting reflection

ALUMNO: Buntarou Emiliano Orduño Hara

CARRERA: Licenciatura en Ingeniería de Software

23 de septiembre de 2025

UXTesting

One UX attribute that was not included in our final project is Accessibility. Accessibility in UX refers to designing digital products that can be used effectively by people with diverse abilities, including those with visual, auditory, cognitive, or motor impairments [1]. While usability ensures that a system is efficient and easy to use, accessibility extends this by ensuring inclusivity and removing barriers that could prevent some users from having a satisfactory experience.

In the context of our project, accessibility could be mapped through the implementation of keyboard navigation shortcuts and screen reader compatibility. For example, instead of relying only on visual icons or mouse input, users should be able to complete core actions through the keyboard and for the blind people, the option to convert digital text to synthesized speech.

A useful metric for accessibility would be the Task Completion Rate for users with assistive technologies. For example, we could measure what percentage of tasks (e.g. logging, searching, or confirming an action) are successfully completed using only keyboard navigation.

A scenario would be that a user with limited motor abilities wants to navigate through the platform without using a mouse and the task would be to use only the keyboard to log in, navigate to a specific section, and perform standard action.

The data collected would include Task completion rate, number of errors, and time to complete tasks (Quantitative) and User feedback on perceived difficulty, frustration, and satisfaction (Qualitative). It could be analyzed by comparing completion rates between users with and without assistive technologies. Additionally, thematic analysis of qualitative feedback could reveal recurring issues.

Measuring accessibility is crucial because it directly affects inclusivity and satisfaction. A product that is not accessible excludes a segment of users, reducing overall user experience quality. Not as an obvious reason, but a good image is in my opinion also relevant. Accessibility aligns with broader definitions of UX as it encompasses emotional impact, inclusivity, and user satisfaction beyond efficiency.
